

Proposed North Star Metric

One metric that works for a developer making an API call and a bank running a voice agent — and that gets worse, not better, when model quality drops.

STATUS Proposed, not official	CADENCE Weekly	COVERS Self-serve + enterprise	CANDIDATES REJECTED 4
----------------------------------	-------------------	-----------------------------------	--------------------------

DISCLAIMER

This is a *proposed* North Star Metric derived from public information and product reasoning. It is not Sarvam AI's actual internal North Star Metric, which has not been publicly disclosed.

6.1 The metric

PROPOSED NORTH STAR

Weekly Successful AI Tasks Completed by Active Developers & Enterprise Customers

A **successful task** = a completed API call or agent conversation that did not error out and was not immediately retried or abandoned.

6.2 Why this metric survives scrutiny

CRITERION	WHY IT FITS
Reflects real value delivered	Counts <i>successful</i> usage rather than signups or raw call volume, which would include failed and retried noise
Works across both buyer types	A "task" can be a developer's API call or an enterprise voice-agent conversation — it unifies the self-serve and enterprise motions under one number
Leads revenue	Because pricing is usage-based (₹ per token, minute, character), more successful tasks means more revenue almost by construction
Sensitive to quality, not just volume	If model quality degrades and hallucinations or errors rise, successful tasks fall even when raw traffic doesn't — which keeps the metric honest

6.3 How it ladders down

THE FULL METRICS TREE WITH OWNERS IS EXPANDED IN SECTION 7

6.4 Candidates considered and rejected

CANDIDATE	WHY NOT CHOSEN AS THE PRIMARY METRIC
Total API calls	Does not distinguish success from failure — a vanity risk. A spike caused by retry loops would read as growth.
Total conversations processed	A strong PR number (100M+), but cumulative and lagging — it cannot be moved or read weekly.
Revenue	A result of good product-market fit, not a leading indicator a product manager can act on within a week.
Developer signups	Easy to inflate, because free credits attract tourists. Captures interest rather than retained value.

THE JUDGEMENT BEING DEMONSTRATED

Every rejected candidate is easier to measure than the one selected. Choosing the harder metric — one that requires defining what "successful" means and instrumenting for it — is the actual product decision here.
