

# Product Strategy

The prioritised opportunities sequenced into NOW, NEXT, and LATER — with the explicit test every item had to pass to earn a place.

| HORIZON            | TIMEFRAMES              | INITIATIVES | ADMISSION TEST           |
|--------------------|-------------------------|-------------|--------------------------|
| NOW · NEXT · LATER | 0–1 · 1–2 · 2+ quarters | 8           | Must move the North Star |

## 12.1 The roadmap

| NOW<br>0–1 QUARTER · QUICK WINS                                                                                                                                                                                                                                                                                   | NEXT<br>1–2 QUARTERS · MEDIUM-TERM                                                                                                                                                                                                                                                                                                                                                                                                                                                      | LATER<br>2+ QUARTERS · STRATEGIC BETS                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## 12.2 NOW — high impact, low effort

| INITIATIVE                             | RATIONALE                                                                                                                                                                       |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Live credit / cost estimator at signup | Highest RICE score in Section 11 at an effort rating of 2. Directly fixes the trust gap identified at teardown Stage 3, where developers cannot tell what ₹1,000 actually buys. |
| Model / version selection guidance     | A banner or tooltip on the docs — "New here? Start with Sarvam-30B + Saaras V3." Cheap to ship and removes a real point of first-call confusion from teardown Stage 5.          |

### 12.3 NEXT — important medium-term work

| INITIATIVE                         | RATIONALE                                                                                                                                                                 |
|------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Use-case-first onboarding redesign | Requires genuine design and engineering investment, but it addresses the single biggest funnel leak found anywhere in this study. Fully specified in Section 10.          |
| In-dashboard usage analytics       | Improves self-serve retention while reducing support load — a rare initiative that pays back on two branches of the metrics tree at once. Needs data infrastructure work. |
| Self-serve "Growth" mid-tier plan  | Requires pricing, legal, and billing changes. In exchange it unlocks an entire revenue segment sitting between free-tier tinkerers and full enterprise contracts.         |

### 12.4 LATER — high-risk strategic bets

| INITIATIVE                                     | RATIONALE                                                                                                                                                                              |
|------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| AI onboarding assistant                        | Chat-guided setup inside the docs is genuinely differentiated, but confidence is currently low. The right sequencing is to validate demand with the cheaper NOW and NEXT items first.  |
| Automated self-serve → enterprise upgrade path | Structurally hard across pricing, contracts, and compliance — but over time it could meaningfully shorten enterprise sales cycles and reduce dependence on forward-deployed headcount. |
| Indus consumer monetisation strategy           | Currently free and in beta. Defining a monetisation model — advertising, subscription, or B2B2C distribution — is a genuine strategic bet carrying real business-model risk.           |

### 12.5 The strategic through-line

#### THE ADMISSION TEST

Every NOW and NEXT item ladders back to the North Star Metric from **Section 6** by doing one of three things: increasing activation rate, increasing engagement and retention, or unlocking a new revenue tier. Anything that could not be traced to one of those three was cut — which is why the docs rebrand appears in the opportunity matrix but not on this roadmap.

#### Activation

LEVER 1

Estimator, version guidance, and the onboarding redesign all target first-successful-call rate and time-to-first-call.

#### Retention

LEVER 2

Usage analytics gives developers the self-diagnosis loop that turns a first success into a weekly habit.

#### Revenue tier

LEVER 3

The Growth plan captures value from developers who currently churn at the "contact sales" wall.
